Step 1 - Create a very simple API

Design and implement a simple API in one of the following languages:

- Python
- Ruby
- Go
- JavaScript (Node.js)

It should have a /hello endpoint that accepts an optional argument name and returns Hello < name > !. If no argument is provided, your endpoint should return Hello > stranger!.

Bonus:

- Save the names in a datastore of your choice.
- Test your code.
- Keep it simple.
